AChemKit Documentation

Release 0.1

Adam Faulconbridge

April 08, 2011

CONTENTS

CHAPTER

ONE

README

1.1 Description

PyAChemKit is a Python implementation of an Artificial Chemistry Kit - a library and collection of tools.

Artificial Chemsistry (AChem) is a spin-off topic of Artificial Life. AChem is aimed at emergence of life from non-living environment - primordial soup etc.

1.2 Installation

To install on Unix/Linux, run

Literal block expected; none found.

sudo python setup.py install

This package should work on windows, but is untested.

This package requires the following:

- Python >= 2.6 http://www.python.org/

Optionally, the following can be installed to improve performance:

- Psyco http://psyco.sourceforge.net
- PyPy http://codespeak.net/pypy

1.3 Source

Source code is available from https://github.com/afaulconbridge/PyAChemKit

The source code additionally requires the following:

- Sphinx >= 1.0 http://sphinx.pocoo.org/
- Graphviz http://www.graphviz.org/
- Make http://www.gnu.org/software/make/
- LaTeX http://www.latex-project.org/
- PyLint >=0.13.0 http://www.logilab.org/project/pylint/
- Coverage http://nedbatchelder.com/code/coverage/

For a Debian-based Linux distrbution — e.g. Debian, Ubuntu — these can be installed / updated with:

```
make setup
```

(Note, LaTeX is not installed via this method because it is very large. Run `sudo apt-get install texlive-full`)

There is a makefile that will run some useful tasks for you (generate documentation, test, benchmark). This can be accessed by running the following command:

```
make help
```

1.4 Copyright

CHAPTER

TWO

FILE FORMATS

AChemKit uses a number of text file formats for data storage and as intermediates between various components.

2.1 *.chem* Format

The *.chem* format is used to abstractly describe a chemistry in terms of reactions. Each reaction is represented as a single line, separated into reactants and products by the symbol ->. Blank lines and lines starting with # are ignored - this is useful to remove reactions temporarily or to add documentation. Additional white-space within a line is also ignored.

Reactants and/or products can contain multiple molecular species, separated by +. No explicit restrictions are placed on the names of molecular species, but it is recommended to be restricted to alpha-numeric characters (upper-case and lower-case) as well as *()* and *[]*. In particular, the following should be avoided: +, -, >. At this time, escaping or quoting is not supported.

The reactant/product separator -> is also used to represent the rate constant of the reaction, if specified. This is done by a floating-point number between the - and > characters. For example, *-2.0>* represents a reaction with a rate constant of 2.0. Integers can also be used, but will be converted to floating-point, e.g. *-2>* is a rate constant of 2.0. If a rate constant is not specified, it defaults to 1.0. Rate constants <=0.0 are not valid, and in some situations rate constants >1.0 may not be either.

It is not valid to have more than one reaction with the same combination of reactants and products - in any order and with any rate. For example, *A + B -> C* cannot appear in the same file as *B + A -2.0> C*.

It is not valid to have the same molecular species in both reactants and products. For example *A + B -> B + A* is not valid.

Either the reactants or products can be omitted from a reaction, e.g. *A ->*. This corresponds to material being added or removed from the system.

When a *.chem* file is generated, reactants and products of all reactions are sorted by their string representations, and then reactions are sorted before being output.

Below is a valid example *.chem* file:

```
#This is a comment

#Here are some blank lines

#Now for some reactions
A + B -> AB

#The same molecular species can be used again
A -> C
```

```
#A reversible reaction can be specified by
#stating the inverse of an existing reaction
C -> A

#Some reactions have rate constants other than 1.0
D -10.0> E
F -0.01> G

#Any number of molecular species can be in the reactants and/or products
#The same molecular species can be in the reactants and/or products multiple times
Spam + Spam + Spam + Eggs + Spam -> Breakfast
Catalyst + Input -> Catalyst + Output

#Things can be created and destroyed
-> TheUniverse
TheUniverse ->
```

CHAPTER

THREE

PROJECT MODULES

3.1 AChemKit Package

3.1.1 AChemKit Package

Detailed documentation for all the components of AChemKit. It is generated directly from the source code, so should be up-to-date.

3.1.2 bucket Module

Library for working with Bucket objects; instances of a simulation of an Artificial Chemistry.

Various tools for going between ReactionNetwork and Bucket objects, as well an analysing the data within Bucket objects.

class AChemKit.bucket.**Bucket**(*events*)

Bases: object

Event history of a simulation of an Artificial Chemistry.

classmethod from_file(*file*)

Alternative constructor that accepts a file() object (or equivalent).

Source must be formatted as a bucket log file, see *bucket_file_format*.

classmethod from_filename(*infilename*)

Wrapper around from_file() that opens the provided filename as a file to read.

classmethod from_string(*instr*)

Wrapper around from_file() that uses StringIO.

reactionnet

A property that generates and caches a ReactionNetwork object representing the reaction network exhibited by this bucket.

Rates are calculated based on repeats of events in this bucket. This may have a large sampling error depending on how many repeates there were.

class AChemKit.bucket.**Event**(*time*, *reactants*, *products*)

Bases: object

Mini-class for tracking events (instances of a reaction) within a Bucket.

Supports comparisons, is hashable, is immutable.

3.1.3 properties Module

Functions for testing properties of particular reaction networks.

These functions expect an object of class AChemKit.reactionnet.ReactionNetwork or subclass or something with an equivalent API. It does not enforce this however, so you may use custom classes with the same API.

Some of these properties have logical prerequisites, but these are not tested for explicitly.

AChemKit.properties.**has_catalysis_direct**(*rn*)
Tests for reactions where some species is both consumed and produced by the same reaction.

For example:

```
A + C -> B + C
AB + C -> A + B + C
```

AChemKit.properties.**has_decomposition**(*rn*)
Tests for reactions where reactants combine to produce more products.

For example:

```
AB -> A + B
AB + C -> A + B + C
```

AChemKit.properties.**has_divergence**(*rn*)
Tests for divergent reactions.

Divergent reactions are where the same reactants have multiple possible collections of products.

For example:

```
AB + C -> ABC
AB + C -> A + B + C
```

AChemKit.properties.**has_reversible**(*rn*)
Tests for a pair of reactions where the products of one is the reactants of the other and visa vera.

For example:

```
A + B -> AB
AB -> A + B
```

AChemKit.properties.**has_synthesis**(*rn*)
Tests for reactions where reactants combine to produce fewer products.

May also be called a *combination reaction*.

For example:

```
A + B -> AB
A + B + C -> AB + D
```

AChemKit.properties.**has_varying_rates**(*rn*)
Tests that the reaction network has different rates for different reactions.

To get the range of rates a reaction network spans, use:

```
span = max(rn.rates.values())-min(rn.rates.values())
```

AChemKit.properties.**not_conservation_mass**(*rn*)
Tests for violation of conservation of mass.

Note, we can show that a reaction network breaks conservation of mass, but not prove that it obeys it.

This is done by arranging all the molecules into a partially ordered set - a tree from largest to smallest. If this cannot be done, then conservation of mass must be violated. If this can be done, then conservation of mass may or may not apply - it cannot be said for certain.

This requires that each molecular species can be separated into individual atoms. If this is not possible, then this function will not work.

NEEDS TO BE WRITTEN

(Credit to Adam Nellis for algorithm)

3.1.4 `properties_wnx` Module

Various functions that interact with NetworkX (http://networkx.lanl.gov/)

AChemKit.properties_wnx.**MultiDiGraph_make_flow**(*G*, *sizeprop=0.5*, *catalysts=True*)
Creates a *flow* network from a MultiDiGraph (usually created by ReactionNetwork_to_MultiDiGraph).

sizeprop is the proportion if the larger molecule that must be contained in the smaller one.

catalysts determines if catalsysts should be considered when looking at edges between reactants and products. If this is false, then molecules that are both in the reactants and the products are removed and do not flow.

AChemKit.properties_wnx.**ReactionNetwork_to_MultiDiGraph**(*net*)
Converts a ReactionNetwork (or class with same interface) to a MultiDiGraph.

Converts each reaction into a node, and each molecular species into a node.

AChemKit.properties_wnx.**find_cycles**(*G*)
Find some of the cycles in G.

Does this by splitting it into strongly connected subgraphs, then for each edge of each node find the shorted path exists that goes the other way. If it does, then it is a cycle.

Once cycles are found, they are ordered so the lowest node is first. Repeated cycles are ignored.

Ineffeicient algorithm, needs optimization for large highly-connected graphs.

3.1.5 `randomnet` Module

Functions that construct random `ReactionNetwork` instances by various methods.

This is designed to provide null hypothesis data for various situations and metrics. As with random graphs, there is no single best way to generate a random reaction network.

AChemKit.randomnet.**Linear**(*natoms*, *maxlength*, *pform*, *pbreak*, *directed=True*, *rates=1.0*, *cls=<class 'AChemKit.reactionnet.ReactionNetwork'>*, *rng=None*)
Generates a random `ReactionNetwork` from molecules that are strings of atoms and can join together or break apart.

Based on the paper Autocatalytic sets of proteins. 1986. Journal of Theoretical Biology 119:1-24 by Kauffman, Stuart A. but without the explicit catalytic activity.

Arguments:

natoms Number of atoms to use. Can be a single value or a tuple/list which will be uniformly sampled from (duplicates can be used to give a non-uniform distribution), or a dict of value:weight which will be sampled from.

Note: AChemKit.reactionnet.ReactionNetwork tracks molecules by their reactions, so if a molecule is not part of any reaction it will not appear at all e.g. in seen.

---

maxlength Maximum number of atoms in a molecule. If this is None, then they are unbounded; this might cause problems with a computational explosion. Can be a single value or a tuple/list which will be uniformly sampled from (duplicates can be used to give a non-uniform distribution), or a dict of value:weight which will be sampled from.

pform Probability that a pair of molecules will join together per orientation. Must be between 0 and 1. Can be a single value or a tuple/list which will be uniformly sampled from (duplicates can be used to give a non-uniform distribution), or a dict of value:weight which will be sampled from.

pbreak Probability that any pair of atoms will break. Must be between 0 and 1.Can be a single value or a tuple/list which will be uniformly sampled from (duplicates can be used to give a non-uniform distribution), or a dict of value:weight which will be sampled from.

directed If false, molecules have no intrinsic direction so AlphBeta is equivlanet to BetaAlpha.

rates Rate of each reaction in the reaction network. Can be a single value, or a tuple/list which will be uniformly sampled from (duplicates can be used to give a non-uniform distribution), or a dict of value:weight which will be sampled from.

cls Alternative class to use for constructing the return rather than AChemKit.reactionnet.ReactionNetwork.

rng Random number generator to use. If not specifed, one will be generated at random.

AChemKit.randomnet.**Uniform**(*nmols*, *nreactions*, *nreactants*, *nproducts*, *rates=1.0*, *cls=<class 'AChemKit.reactionnet.ReactionNetwork'>*, *rng=None*)

Generates a random ReactionNetwork by assigning reaction randomly between all molecular species.

Arguments:

nmols Number of molecules in the reaction network.

Note: AChemKit.reactionnet.ReactionNetwork tracks molecules by their reactions, so if a molecule is not part of any reaction it will not appear at all e.g. in seen. This could lead to differences from *nmols*.

---

nreactions Number of reaction in the reaction network.

Note: The value of *nreactions* is the number of times a reaction will be added to the ReactionNetwork. If it is already in the ReactionNetwork, it will be replaced. This can lead to AChemKit.reactionnet.ReactionNetwork with less than *nreactions* reactions.

---

nreactants Number of reactants for each reaction in the reaction network. Can be a single value or a tuple/list which will be uniformly sampled from (duplicates can be used to give a non-uniform distribution).

Note: If this is a tuple/list it will be sampled for each reaction.

---

nproducts Number of products for each reaction in the reaction network. Can be a single value or a tuple/list which will be uniformly sampled from (duplicates can be used to give a non-uniform distribution).

If this is None, then *nreactants* must be a list/tuple of tuples of (*nreactants*, *nproducts*) pairs that will be uniformly sampled from. Or *nreactants* must be a dictionary with keys of (*nreactants*, *nproducts*) and values of weightings, which will be sampled from.

Note: If this is a tuple/list it will be sampled for each reaction.

---

rates Rate of each reaction in the reaction network. Can be a single value or a tuple/list which will be uniformly sampled from (duplicates can be used to give a non-uniform distribution).

Note: If this is a tuple/list it will be sampled for each reaction.

---

cls Alternative class to use for constructing the return rather than `AChemKit.reactionnet.ReactionNetwork`.

rng Random number generator to use. If not specifed, one will be generated at random.

These arguments can be a single value, a tuple/list which will be uniformly sampled from, or a dictionary of value/weighting which will be sampled from

For example:

`Uniform(5,3,2,1)` will generate 5 molecules with 3 reactions between them where each reaction has two reactants and one product.

`Uniform(5,3,(1,2), (1,2))` will generate 5 molecules with 3 reactions between them where each reaction has one or two reactants and one or two products.

`Uniform(5,3,((2,1),(1,2)), None)` will generate 5 molecules with 3 reactions between them where each reaction has either two reactants and one product or one reactant and two products.

`AChemKit.randomnet.`**`combinations_with_replacement`**(*iterable*, *r*)

3.1.6 `randomnet_test` Module

This is the test harness for `AChemKit.randomnet`.

Tricky to test well because it is non-deterministic.

class `AChemKit.randomnet_test.`**`TestLinear`**(*methodName='runTest'*)

Bases: `unittest.TestCase`

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

`setUp`()

`test_directed`()

`test_maxlengt_dict`()

`test_maxlengt_tuple`()

`test_natoms_dict`()

`test_natoms_int`()

`test_natoms_tuple`()

`test_pbreak_tuple`()

`test_pform_tuple`()

test_undirected()

class AChemKit.randomnet_test.**TestUniform**(*methodName='runTest'*)
Bases: unittest.TestCase

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

setUp()

test_nmols_dict()

test_nmols_int()

test_nmols_list()

test_nmols_tuple()

test_nprods_dict()

test_nprods_int()

test_nprods_list()

test_nprods_none_dict()

test_nprods_none_tuple()

test_nprods_tuple()

test_nreacts_dict()

test_nreacts_int()

test_nreacts_list()

test_nreacts_tuple()

test_rate_dict()

test_rate_float()

test_rate_int()

test_rate_list()

test_rate_tuple()

3.1.7 reactionnet Module

Core for all ReactionNetwork classes

Of particular note are the alternative constructors of ReactionNetwork, from_file(), from_filename() and from_string().

class AChemKit.reactionnet.**ReactionNetwork**(*rates*)
Bases: object

A dictionary of reactions where each key is a reaction composed of (reactants, products) and each value is the rate.

ReactionNetwork objects are immutable and hashable.

ReactionNetwork objects support __eq__() and __ne__(), but none of the other rich comparison operators (__lt__, __le__, __gt__, __ge__).

Different subclassess could be implemented to generate reaction networks on demand (artificial chemistries, etc) and provide additional functionallity, such as visualization or metrics.

Can be cast to string to get a *.chem* representation.

classmethod **from_file**(*infile*)
Alternative constructor that accepts a `file()` object (or equivalent).

Source must be formatted as a .chem file, see *.chem Format*.

classmethod **from_filename**(*infilename*)
Wrapper around `AChemKit.reactionnet.ReactionNetwork.from_file()` that opens the provided filename as a file to read.

classmethod **from_string**(*instr*)
Wrapper around `AChemKit.reactionnet.ReactionNetwork.from_file()` that uses `StringIO`.

classmethod **reaction_to_string**(*reaction*, *rate=1.0*)
Produces a human-readable string for a particular reaction.

Mainly used to convert entire reaction network to a string representation, but can also be used for individual reactions if desired.

reactions
Sorted tuple of all reactions in the network

seen
Sorted tuple of all molecular species in the network

3.1.8 reactionnet_test Module

This is the test harness for `AChemKit.reactionnet`.

class `AChemKit.reactionnet_test.`**TestReactionNetwork**(*methodName='runTest'*)
Bases: `unittest.TestCase`

This is the main class to test ReactionNetwork class.

It relies on setUp to generate a ReactionNetwork instance which is then probed by the other functions

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

setUp()

test_equal()
As ReactionNetwork has a custom __eq__ function, it is tested here.

Needs to both pass and fail.

test_hash()
As ReactionNetwork has a custom __hash__ function, it is tested here.

Needs to both pass and fail.

Technically, the fail here could be true and still be a hash but it is supposed to usually be wrong so assume that it will be wrong.

test_rates()

test_reaction_to_string()
Check that it convert a reaction to a string correctly

test_reactions()
Makes sure the reactions that were specified are in reactions. Also checks that they are in sorted order TODO check sorted order between reactions

test_seen()
Makes sure the molecules that were specified are in seen. Also checks that they are in sorted order.

test_to_string()
Check that it converts to a string correctly

class AChemKit.reactionnet_test.**TestReactionNetwork_from_string**(*methodName='runTest'*)
Bases: AChemKit.reactionnet_test.TestReactionNetwork

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

setUp()

3.1.9 reactionnetdot Module

class AChemKit.reactionnetdot.**ReactionNetworkDot**(*rates*)
Bases: AChemKit.reactionnet.ReactionNetwork

This is a subclass of AChemKit.reactionnet.ReactionNetwork that adds a *.dot* representation. It is in a subclass so that on machines where dot is not installed, the basic class can still be used.

dot
Property wrapper around to_dot() to provide attribute-like access.

to_dot(*names=None*, *rates=None*, *shown=()*, *hidden=()*)
Return a *.dot* format string constructed using a AChemKit.utils.simpledot.SimpleDot view of this reaction network.

Molecular species are shown as either full names, identifier numbers, or as blank circles. This is determined by the *names* parameter, which is a string indicating which to use:

"full" This will use the full molecule name specified in the .chem file

"id" This will use a shortened identifier of that molecules index in the seen tuple.

"blank" This will not name any molecules, but will put an empty circle instead.

A sub-set of the reaction network can be drawn using the *shown* and *hidden* parameters.

Reactions involving only molecular species on the *hidden* list are not shown. Molecular species on the *hidden* list are not shown unless they are involved in a reaction with molecular species not on the *hidden* list, in which case the molecular species on the *hidden* list is unlabeled and shown as a point.

The *shown* list in the inverse of the hidden list. If it is used, any molecular species not on the *shown* list is treated as being on the *hidden* list. If a molecular species is on both *shown* and *hidden* lists, the *hidden* lists wins.

Catalysts (defined as molecules that are required for but unchanged by a reaction) are indicated with a grey line.

Reversible reactions (defined as a pair of reactions where reactants of one are the products of the other and visa versa) are combined and indicated with double arrows resembling a diamond shape.

3.1.10 reactionnetdot_test Module

This is the test harness for AChemKit.reactionnetdot.

class AChemKit.reactionnetdot_test.**TestReactionNetworkDot**(*methodName='runTest'*)
Bases: unittest.TestCase

This is the main class to test ReactionNetwork class.

It relies on setUp to generate a ReactionNetwork instance which is then probed by the other functions

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

setUp()

test_to_dot_str()
Test for dot conversion by string representation

Assumes that the dot representation itself is valid

3.1.11 sims_gillespie Module

class AChemKit.sims_gillespie.**Gillespie**(*achem*, *mols*, *rng*, *intervalscaling=100.0*)
Bases: object

next_reaction()

AChemKit.sims_gillespie.**simulate_gillespie**(*achem*, *mols*, *maxtime*, *rng=None*)

AChemKit.sims_gillespie.**simulate_gillespie_iter**(*achem*, *mols*, *maxtime*, *rng=None*)
Given an Artificial Chemistry, this simulates a series of simple iterative reactions. It returns events as tuples of (time, reactants, products).

This is an implementation of the Gillespie algorithm. It is a simulation of a well-mixed container.

Is an iterator to reduce memory consumption. See simulate_gillespie for this function wrapped in a tuple.

3.1.12 sims_gillespie_test Module

This is the test harness for AChemKit.sims_simple.

class AChemKit.sims_gillespie_test.**TestGillespie**(*methodName='runTest'*)
Bases: unittest.TestCase

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

setUp()

test_basic()

3.1.13 sims_simple Module

class AChemKit.sims_simple.**AChemAbstract**
Bases: object

This is an abstract base class for an AChem that can be used in a simulation or similar. It defines core attribtues and functions that subclasses must implement in order to follow the API correctly.

It is not required that an AChem inherits this, as Python follows the principle of "duck typing".

react(**reactants*)
Given some number of reactants, return the products.

The reactant objects should not be changed. Rather, copies should be returned. This is so events and buckets work correctly.

class AChemKit.sims_simple.**AChemReactionNetwork**(*reactionnetwork*)
Bases: AChemKit.sims_simple.AChemAbstract

This is an AChem class that uses a Reaction Network as its base.

The main point of this is to be able to compare different simuatlion approaches to see which ones best reconstruct the original Reaction Network.

react(**reactants*)

AChemKit.sims_simple.**simulate_itterative**(*achem*, *mols*, *maxtime*, *rng=None*)

AChemKit.sims_simple.**simulate_itterative_iter**(*achem*, *mols*, *maxtime*, *rng=None*)
Given an Artificial Chemistry, this simulates a series of simple iterative reactions. It returns events as tuples of (time, reactants, products).

One reaction occurs each second for a number of seconds up to the maximum time specified.

Works as an iterator to reduce memory consumption. See simulate_itterative for this function wrapped in a tuple.

AChemKit.sims_simple.**simulate_stepwise**(*achem*, *mols*, *maxtime*, *rng=None*)

AChemKit.sims_simple.**simulate_stepwise_iter**(*achem*, *mols*, *maxtime*, *rng=None*)
Given an Artificial Chemistry, this simulates a series of simple iterative reactions. It returns events as tuples of (time, reactants, products).

Each molecule will attempt to react once for each second. If there are any leftover molecules, they will get a free pass to the next second.

Is an iterator to reduce memory consumption. See simulate_stepwise for this function wrapped in a tuple.

AChemKit.sims_simple.**simulate_stepwise_multiprocessing**(*achem*, *mols*, *maxtime*, *rng=None*)

AChemKit.sims_simple.**simulate_stepwise_multiprocessing_iter**(*achem*, *mols*, *maxtime*, *rng=None*)
Given an Artificial Chemistry, this simulates a series of simple iterative reactions. It returns events as tuples of (time, reactants, products).

Each molecule will attempt to react once for each second. If there are any leftover molecules, they will get a free pass to the next second.

Is an iterator to reduce memory consumption. See simulate_stepwise_multiprocessing for this function wrapped in a tuple.

Uses multiprocessing to parallelize reactions. This does not work that well because the individual reactions are not that complicated.

3.1.14 sims_simple_test Module

This is the test harness for AChemKit.sims_simple.

class AChemKit.sims_simple_test.**TestItterative**(*methodName='runTest'*)
Bases: unittest.TestCase

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

setUp()

test_basic()

class AChemKit.sims_simple_test.**TestStepwise**(*methodName='runTest'*)
Bases: AChemKit.sims_simple_test.TestItterative

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

test_basic()

class AChemKit.sims_simple_test.**TestStepwiseMultiprocessing**(*methodName='runTest'*)
Bases: AChemKit.sims_simple_test.TestItterative

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

test_basic()

3.1.15 Subpackages

tools Package

tools Package

AChemKit comes with a number of complete command-line driven tools for working with various file types.

These are intended to be used in automated pipelines, such as Makefiles.

These can be used as stand-alone programs, or examined as usage examples for the AChemKit *API*.

chem_linear Module

This is a command-line tool for generating *.chem* files using the Linear() random reaction network algorithm.

chem_pp Module

A pretty-printer and syntax checker for *.chem* files

For information in *.chem* files see *.chem Format*.

Usage: chem_pp.py [options]

Options:

-h, --help show a help message and exit

-i INFILE, --infile=INFILE read from INFILE (if ommited, use stdin)

-o OUTFILE, --outfile=OUTFILE write to OUTFILE in .chem format (if ommited, use stdout)

chem_to_dot Module

Produces a *.dot* output from a provided *.chem* format input

The output files in *.dot* format are suitable for future processing using Graphviz tools. In particular, they are constructed using `AChemKit.utils.simpledot.SimpleDot`.

For information in *.chem* files see *.chem Format*.

Usage: chem_to_dot.py [options]

Options:

-h, --help Show a help message and exit

-i INFILE, --infile=INFILE Read from INFILE (if ommited, use stdin)

-o OUTFILE, --outfile=OUTFILE Write to OUTFILE in .chem format (if ommited, use stdout)

-n NAMES, --names Style of molecular species naming. One of 'full', 'id', 'blank'

chem_to_pdf Module

Produces a *.pdf* output from a provided *.chem* format input

The output files in *.pdf* format produced using Graphviz tools. In particular, they are constructed using `AChemKit.utils.simpledot.SimpleDot`.

For information in *.chem* files see *.chem Format*.

Usage: chem_to_pdf.py [options]

Options:

-h, --help show a help message and exit

-i INFILE, --infile=INFILE read from INFILE (if ommited, use stdin)

-o OUTFILE, --outfile=OUTFILE write to OUTFILE in .pdf format (if ommited, use stdout)

-l LAYOUT, --layout=LAYOUT Graphviz layout to use (if ommited, use dot)

chem_uniform Module

This is a command-line tool for generating *.chem* files using the `Uniform()` random reaction network algorithm.

log_to_chem Module

Produces a *.chem* output from a provided *.log* format input

For information in *.chem* files see *.chem Format*.

Usage: chem_to_dot.py [options]

Options:

-h, --help Show a help message and exit

-i INFILE, --infile=INFILE Read from INFILE (if ommited, use stdin)

-o OUTFILE, --outfile=OUTFILE Write to OUTFILE in .chem format (if ommited, use stdout)

-n NAMES, --names Style of molecular species naming. One of 'full', 'id', 'blank'

utils Package

utils Package

Various utility functions and classes.

bag Module

A collection of classes providing containers. These use the abstract base classes (ABCs) from collections module to satisfy isinstance() criteria for API provision.

class AChemKit.utils.bag.**Bag**(*iterable*)
Bases: AChemKit.utils.bag.FrozenBag, _abcoll.MutableSet

A Bag is like a set, but can contain duplicates.

Also, a Bag is like a list, but is always ordered.

add(*item*)

discard(*item*)

class AChemKit.utils.bag.**FrozenBag**(*iterable*)
Bases: _abcoll.Set

A Bag is like a set, but can contain duplicates.

Also, a Bag is like a list, but is always ordered.

class AChemKit.utils.bag.**OrderedBag**(*iterable*)
Bases: AChemKit.utils.bag.OrderedFrozenBag, _abcoll.MutableSet

Like a Bag, but iterating will keep the order things were put in. New items are added to the end of the OrderedBag - if you need anything else you can convert it to a tuple or list and make a new bag.

Comparisons are still as for a Bag so OrderedBag([1,2,1]) == OrderedBag([2,1,1]) will return True.

add(*item*)

discard(*item*)

class AChemKit.utils.bag.**OrderedFrozenBag**(*iterable*)
Bases: _abcoll.Set

Like a FrozenBag, but iterating will keep the order things were put in.

Comparisons are still as for a FrozenBag so OrderedFrozenBag([1,2,1]) == OrderedFrozenBag([2,1,1]) will return True.

bag_test Module

This is the test harness for AChemKit.utils.bag.

class AChemKit.utils.bag_test.**TestBag**(*methodName='runTest'*)
Bases: AChemKit.utils.bag_test.TestFrozenBag

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

cls
alias of Bag

setUp()

test_add()

test_discard()

test_hash()

class AChemKit.utils.bag_test.**TestFrozenBag**(*methodName='runTest'*)
Bases: unittest.TestCase

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

cls
alias of FrozenBag

setUp()

test_eq()

test_hash()

test_iter()

test_len()

test_repr()

test_str()

class AChemKit.utils.bag_test.**TestOrderedBag**(*methodName='runTest'*)
Bases: AChemKit.utils.bag_test.TestOrderedFrozenBag, AChemKit.utils.bag_test.TestBag

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

cls
alias of OrderedBag

setUp()

class AChemKit.utils.bag_test.**TestOrderedFrozenBag**(*methodName='runTest'*)
Bases: AChemKit.utils.bag_test.TestFrozenBag

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

cls
alias of OrderedFrozenBag

setUp()

test_iter()

simpledot Module

A library to manage *.dot* files

There are existing python libraries for this, but they do not always do it correctly (e.g. PyDot does not respect order within a .dot file).

class AChemKit.utils.simpledot.**SimpleDot**(*name='G'*, *digraph=True*, *strict=False*, *cluster=False*)

Bases: UserDict.DictMixin

Repsents a graphviz *.dot* file (also known as *.gv*).

Uses a dictionary-like interface via the :class:~'UserDict.DictMixin' class.

To produce *.dot* output, cast to string e.g. *str(mysimpledot)*

Contains three types of graph objects:

Nodes Named by strings and are dictionaries of attributes.

Edges Named by tuples of length 2 of strings and are are dictionaries of attributes. Nodes will be implicitly created by graphviz if they do not exist, and therefore do not need to be explicitly created.

Subgraphs Named by strings and are instances of this class. Some graphviz layout engines (e.g. *neato*) will flatten subgraphs.

These can be set and accessed by standard slice notation (e.g. *dot[nodename] = {}*).

Node names and subgraph names are unique but multiple parallel edges are permitted. However, slice notation (e.g. *dot[(from, to)]*) cannot cope with this. Therefore, when there are multiple parallel edges, accessing any of them returns a tuple of all their attributes as dictionaries. To create multiple parallel edges you must use the add() method

Names of nodes and subgraphs, attribute keys, and attribute values should all be graphviz compatible. Some attempt to wrap string attribute values in quotes will be made so that the use of plain python strings is accepted by graphviz.

Very little checking and enforcement is performed. This means that you can use them in ways not originally intended; for example, you can se attributes that no graphviz programme will recognize. But, it also means you can break it by doing odd things to them.

add(*key*, *value=None*)
Guaranteed to add the passed key/value to self, even if it is a duplicate.

get(*key*)
Returns a tuple of all things matching that key.

Designed for multiple edges, but will also work with single edges, nodes, or subgraphs. This provides a unified interface.

keys()
Return a tuple of the keys.

plot(*output='pdf'*, *prog='dot'*, *args=()*)

utils Module

Various small functions that can get combined together.

AChemKit.utils.utils.**get_sample**(*distribution*, *rng=None*)

utils_test Module

This is the test harness for AChemKit.utils.utils.

class AChemKit.utils.utils_test.**TestGetSample**(*methodName='runTest'*)
Bases: unittest.TestCase

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

test_dicts()

test_ints()

test_lists()

CHAPTER

FOUR

TO-DOS

As with any project, there are a number of things that could be done to improve it.

4.1 Features

Faster Any sort of speed up would be nice. Currently, Pysco will by used if avaliable. Shedskin and PyPy are options for futher improvments.

As well as this, algorithmic speed ups and optimizations would be good.

4.2 Bugs
